

SmartTrack Optimization 4

Find Your Hidden SAM Treasures

Your IT infrastructure is constantly changing. Licenses and agreements are adjustable but not flexible, and always under the fear of compliance costs. How do you know which licenses you truly need?

That's where SmartTrack Optimization comes in. These powerful capabilities in SmartTrack Optimization & Simulation 4 analyze how your ever-changing IT affects the demand for licenses. The solution gives a clear view of license ownership and options across your entire software estate.

Now your decision-makers can make informed, strategic decisions that reduce annual software spend. Like a quest for treasure, the solution finds valuable things you didn't realize were hidden.

Reliability for your forecasts

Analyse, calculate and compare licensing models and contract situations for every device, on different platforms and in any infrastructure.

Flexibility for your IT team

Calculate how license changes will affect product configurations and rollouts in seconds. Provide all stakeholders with support for their processes. Benefit from easy operability and fast data processing.

Accuracy for your data and investments

It pays to focus on data quality from the start. Once quality is in place, you will find the right solution and free up licenses and budgets. Invest in new ideas, not unnecessary licensing.

How it works

Identify your true needs. Calculate the minimum license needs for your physical server, virtual server or cluster infrastructure independently from your existing license situation.

Use the right licenses. Discover the optimal way to cover your needs with the licenses you already own. Select the most cost-effective licensing model from your pool instead of the first license that seems to fit.

Become agile and flexible. Say goodbye to static reports. Detailed compliance reporting gives a dynamic view of suitable licenses, contract options and budgets that you can change at any time.

One Giant Leap for SAM-kind

SmartTrack Optimization is part of SmartTrack Optimization & Simulation 4, the breakthrough solution for deep savings in the data center. This industry-changing technology for Software Asset Management endlessly simulates licensing possibilities for your server topologies, virtualization, hybrid, and cloud environments. Take your SAM to a new level of sophistication, all in real time and on-demand.
